WILLIAM E. WARNE
Director
Department of Water Resources

ERRATA SHEET

Bulletin No. 130-63, Hydrologic Data 1963
Volume V
Southern California

The following 13 pages replace pages B-1 through B-13.

These corrected DAILY MEAN DISCHARGE tables are for the years 1961, 1962, and 1963.

CALIFORNIA—RESOURCES AGENCY

WILLIAM E. WARNE, *Director*

RTMENT OF WATER RESOURCES
388
NTO

August 27, 1965

Honorable Edmund G. Brown, Governor, and
Members of the Legislature of the
State of California

Gentlemen:

The Bulletin No. 130 series of reports incorporates data on surface water, ground water, and climate previously published annually in Bulletins No. 23, 39, 65, 66, and 77. With the inauguration of the new series, publication of the earlier reports is suspended.

Bulletin No. 130 will be published annually in five volumes, each volume to report hydrologic data for one of five specific reporting areas of the State. The area orientation map on page iii delineates these areas. Page ii outlines the organization of the bulletin, its volumes and appendixes.

This report is Volume V, "Southern California". It includes a text which summarizes hydrologic conditions in this part of California during the 1963 water year (October 1, 1962 through September 30, 1963) and two appendixes of detailed hydrologic data: Appendix A, "Climate", and Appendix B, "Surface Water Flow". Appendixes C, D, and E will be published separately.

The collection and publication of data such as is contained in Bulletin No. 130 is authorized by Sections 225, 226, 229, 230, 232, 345, 12609, and 12616 of the Water Code of the State of California.

The basic data programs of the Department of Water Resources have been designed to supplement the activities of other agencies, in order to satisfy specific needs of this State. Bulletin No. 130 is designed to present useful, comprehensive, accurate, and timely hydrologic data to the public.

Sincerely yours,

William E. Warne

Director

ACKNOWLEDGMENT

The Department of Water Resources gratefully acknowledges the assistance and contributions of the many public agencies, private organizations, and individuals whose cooperation has greatly facilitated the preparation of this bulletin. In this regard, special mention is made of the following:

Planning Office, Data Coordination Branch

CHAPTER I. HYDROLOGIC CONDITIONS 1962-63

California is an area that is unique in many respects. Its climate has always been exceptional and the range of land forms within the State sets it apart from neighboring areas. California has often been described as being set apart, isolated so to speak, by features that prevail over wide areas adjoining the State. Perhaps it would be more appropriate to consider the State as a link between dissimilar regions rather than isolated by them. California does, in fact, span all the dissimilarities of climate and topography from the arid plateaus of the Great Basin to the marshy tidelands of the Pacific and from the rain forests of the Pacific Northwest to the parched plains of the Sonoran Desert.

Statewide

California climate is fostered by a balance between the slow forces of geology and turbulent storms born of the Pacific Ocean. The massive walls of the Rocky Mountains and the Sierra Nevada protect the State from all but a few thrusts of the dry, cold, polar continental air masses. Maritime air masses, originating far out in the Pacific, receive some impetus and direction from wind patterns of the troposphere and move toward the California coast. California lies in a transition zone between the prevailing westerlies that blow across the North Pacific and a calm high pressure zone, the horse latitudes, in the vicinity of 30 degrees north latitude. The horse latitudes, just south of California, buffer the State from many tropical storms which originate further to the south so that the north coast of California is crossed by more storms than the south coast. The Sierra Nevada and the Cascade Mountains, along the

eastern border of the great Central Valley, receive much of their precipitation by orographic lifting of the maritime air masses, while interior lands of Southern California are shielded from maritime air masses by the Transverse Ranges and the northerly extension of the Peninsular Ranges. The water year, from October 1, 1962, through September 30, 1963, illustrates the extreme variability of weather conditions that occur in the State.

Average values summing up annual conditions for the whole State show the 1962-63 water year to have been about normal. A closer look at this apparent normality shows a series of extreme conditions which in combination resulted in nearly normal averaged values. Figure 2, showing water year precipitation in percent of 30-year mean of the years 1931-1960, indicates that normal annual precipitation amounts were recorded in the latitude of the north line of San Luis Obispo, Kern, and San Bernardino Counties. Recorded annual precipitation south of that latitude ranged to less than 50 percent of normal in the vicinity of San Diego and north of that latitude ranged to greater than 150 percent of normal in the mountains along the northern boundary of the State.

During 1962-63, even these annual precipitation values were composed of extremes. In mid-October a series of storm waves drenched Northern California, Oregon, and Washington. Rivers in Northern California were at near flood level; and Feather River at Oroville reached the highest October stage of record, inundating construction work at the Oroville Dam site. Southern California stayed dry. A midwinter drought followed, setting new records for lack of precipitation and for continuous days of fog in the Central Valley. Again, Southern California was dry.

The drought was broken by a three-day downpour at the end of January. Again, flood conditions prevailed in Northern California and some areas, particularly in the upper Yuba River Basin, suffered from serious floods. Much of Southern California received moderate amounts of rain at this time.

During April, Northern California was covered by a series of storms; precipitation was moderate but continued for almost two weeks. The April rains, along with record late season snowfall during May, largely in the northern Sierra, built up snowpacks and assured a normal water supply during the summer. Southern California gained some precipitation but had a less than normal wet season which extended the dry trend that has prevailed in the southern part of the State since 1944.

Understandably, other hydrologic features showed abnormal responses. Streamflows alternated between extreme highs and extreme lows but were about normal during the summer. With the recurring threat of floods, operation of reservoirs was difficult, yet the amount of water stored in reservoirs at the end of the water year was greater than year-end storage during most of the preceding years. Still, a greater than usual proportion of winter rain flowed directly to the ocean. In Southern California both surface runoff and reservoir storage were below normal.

Ground water conditions followed the irregular pattern of precipitation. In the northern part of the State, the amount of water stored in the ground water basins generally increased. However, due to the intermittent distribution of precipitation, the increase of stored ground water was less than it should have been. Throughout Southern California, where precipitation was well below normal, ground water levels generally continued to drop.

In general, during the 1962-63 season, hydrologic conditions were about normal for the State except the distribution of the normal supply was unusual, the northern part of the State was deluged while Southern California again was below normal.

Southern California

The variability of California climate referred to above is most pronounced in the southern part of the State, so that it is usually difficult to make generalized statements concerning hydrologic conditions. For example, in Southern California mean precipitation can be found to vary in a distance of less than 50 miles from over 40 inches per year to nearly as little as 2 inches per year.

Generally mild climates prevail along the coast because of the proximity of the Pacific Ocean. In the southernmost coastal areas a variety of tropical plants can be grown because of the infrequent occurrence of frost and snow. Because most of the coastal area is mountainous, climatic conditions in the inland areas are different from those on the coast. A series of high mountain ranges, extending from Santa Barbara County east to the San Bernardino Mountains and then southerly through San Diego County into Mexico, have a sharply demarcated effect on climate. The series of mountain ranges extending from the Tehachapis northeasterly and then northerly to merge with the Sierra Nevada causes a similar effect. On the leeward, or inland, side of these mountain ranges, desert conditions generally prevail with wide temperature extremes in the higher deserts. The higher mountains sustain a considerable growth of timber because of the relatively abundant precipitation which can reach to an average of over 40 inches per year. The major part of the precipitation in the

higher mountains is in the form of snow; however, except for the eastern slopes of the Sierra Nevada in Mono and Owens Valleys, accumulated snowpack which produces runoff in the spring and summer is generally not a major water supply factor because the snow usually melts too rapidly to accumulate. Snowfall is important, though, to the natural and artificial recharge of several ground water basins because the precipitation does not run off immediately, thus allowing time for percolation.

Southern California is similar to the rest of the State in that most of the precipitation occurs during the winter months. Precipitation during the months of June through September is usually insignificant. Exceptions occur in the mountain and desert areas where there are occasional summer thunderstorms. On rare occasions, summer tropical storms reach the southern part of the State.

The 1962-63 season is the 19th in a period of generally subnormal precipitation for most of Southern California. During this period, seasonal precipitation that was significantly above normal occurred only three times, the last instance being the previous 1961-62 season. Thus it may be said that a condition of drought is becoming a way of life in Southern California. The severity of the protracted period of drought can be illustrated by the water storage in the major surface reservoirs in San Diego County which contain mostly local runoff. On May 1, 1963, at the close of the runoff-producing season, 11 reservoirs contained 45,200 acre-feet, or 7.1 percent of their capacity of 634,650 acre-feet. One reservoir in San Diego County, San Vicente, which stores imported Colorado River water, contained 59,065 acre-feet on the same date. This example also illustrates the dependence of large areas of Southern California on imported water.

On February 1, 1963, the outlook for supplies of local water was even more bleak than the example cited above. A record-breaking dry year was in prospect, with large areas of Southern California having received less than 10 percent of normal seasonal precipitation by that date. The alarming nature of this situation can be emphasized by pointing out that by the first of February Southern California normally has received about half of the season's precipitation. Exceptions to the above condition were northern San Luis Obispo County and the Mono-Owens region, which shared in the above normal precipitation received by that time in northern parts of the State. However, the bleak outlook was modified by significant precipitation that began to arrive in February and continued through May and partly into June. By July 1, 1963, precipitation was at least 50 percent of normal in most of Southern California. The San Diego area was an exception in having less than 40 percent of normal precipitation. In San Luis Obispo County precipitation for the season was near or above normal, and in parts of the Mono-Owens region it was over 200 percent of normal, partly due to heavy snowfall late in the season. Although beginning as a severe drought year, drier than any on record, the season became a routine year of ordinary precipitation deficiency. The late spring precipitation gave an added bonus in the form of postponing the beginning of the brush and forest fire season.

During September 1963, unusually early precipitation occurred in the extreme southern part of the State, with much of San Diego County receiving over 2 inches, and at high elevations in Los Angeles County over 5 inches were recorded. The storms extended over the Colorado Desert area, where extensive crop damage resulted from rainfall which in places

exceeded 2 inches. The extreme southern part of the Lahontan Drainage Province received over 6 inches of precipitation at the higher elevations. An important effect of the storms was that the brush and forest fire hazard ended earlier in the season than usual.

In Southern California the impact of a deficiency in precipitation varies with geographical area. San Luis Obispo, Santa Barbara, and Ventura Counties have relied solely on local supplies of water, a large part of which is surface runoff; therefore, an extended precipitation deficit in these areas might cause an emergency situation. In the Los Angeles Coastal Plain area, however, imported water supplies, together with a large supply of ground water, are presently adequate to withstand the impact of an extended drought period. In San Diego County no large ground water basins exist, so that water supplies must come mostly from local surface runoff or be imported from the Colorado River. Dry periods in this area increase the cost of water by requiring the purchase of more imported water. In the upper Santa Ana River drainage area, precipitation deficiency causes increased overdraft of ground water and increased imports of Colorado River water. The Colorado River Drainage Province relies mostly on imported Colorado River water, and deficient precipitation may be welcomed rather than lamented because huge crop losses could result from untimely rainfall. In the southern part of the Lahontan Drainage Province, precipitation is important mostly for ground water recharge, since there is no major surface runoff except in Owens Valley and Mono Basin.

In San Luis Obispo, Santa Barbara, and Ventura Counties there was a considerable carry-over of local water stored in surface reservoirs

from the previous 1961-62 season. In Owens Valley and Mono Basin there was a large increase in reservoir storage due to the heavy precipitation in the spring of 1963. The reservoirs on the Colorado River which contain water imported into Southern California showed a considerable decrease in water in storage. There was no significant amount of local water in storage in the remaining reservoirs of Southern California at the end of the 1963 water year.

In summary, the water year ending on September 30, 1963, was another year of generally deficient precipitation in Southern California with resultant deficient runoff and a lack of local water for ground water recharge. Reservoir storage generally declined. Water levels continued to decline in many basins. A notable exception was the Los Angeles Coastal Plain in Los Angeles and Orange Counties where the continuing spreading of imported water and controlled pumping actually resulted in a small rise in water levels.

CHAPTER II. INTRODUCTION TO DATA ACTIVITIES

This is the first report in the Bulletin No. 130 series entitled "Hydrologic Data", and supersedes 31 years of publication of the annual report in the Bulletin No. 39 series and 7 years of publication of the two water quality reports, Bulletins Nos. 65 and 66, on surface and ground water quality, respectively. Consolidation of the three series of reports into the Bulletin No. 130 series and the expansion of the scope of the presentation of data to include the publication of climatological data not published elsewhere, is designed to enhance the value of these reports and considerably reduce the amount of time involved in consolidating hydrologic data by users. Furthermore, this report is a part of a standardized and coordinated reporting procedure for the State of California, which also enhances the availability of hydrologic data and gives an annual summary of hydrologic conditions.

Discussions of ground water recharge, weather modification, sewage discharge to the Pacific Ocean and its tidal estuaries, and miscellaneous activities affecting water supply conditions were added to previous reports and are included in this series to provide a more complete description of hydrologic conditions. Precipitation data which have not been included in the appendixes subsequent to Bulletin No. 39-58, published in August 1960, will be published in later reports in the Bulletin No. 130 series. Subsequent bulletins in this series are planned to include the publication of evaporation, wind, temperature, and agroclimatic data.

Volume V of Bulletin No. 130-63 is itself published under four covers. The first cover contains the text and Appendixes A and B. The

second and third covers contain Appendix C. The fourth cover contains Appendixes D and E.

Objectives and Scope

The purpose of this report is to provide a useful source of information for all interested in water development and supply in Southern California. The basic data programs of the Department of Water Resources are designed to supplement the activities of other agencies to provide a basis for effective water resource management. This report is designed to meet the needs of the Department and the public for hydrologic data.

This report contains a discussion of hydrologic conditions in Southern California for the 1962-63 season, with supporting basic data compiled, and in many cases collected, by the Department of Water Resources and other water agencies operating in the Southern California area. Presented in the report are data on precipitation, surface streamflow, reservoir storage, and elevation of the surface of ground waters, including the consideration of the quality of surface and ground waters. Information is also given on the activities of water agencies.

Data Collection Activities

The major portion of the information on ground water level conditions in Southern California is obtained by local water agencies with the Department of Water Resources acting as the collector and central compiling agency for these records. The Department itself routinely measures only approximately 400 wells semiannually for the collection of water level information. The Department also collects ground water level information during special investigations conducted from time to time in various places throughout Southern California.

The U. S. Geological Survey collects ground water level elevation information in Southern California under a cooperative program between the State of California and the United States government whereby funds are provided by the State to the Survey on a matching basis. The Survey conducts two ground water level measuring programs under this cooperative agreement: (1) a routine measuring of selected wells mainly in the desert areas in Southern California, and (2) a measuring of ground water levels during special investigations of localized areas in Southern California. All these records are published in the Bulletin No. 130 series for the appropriate year.

Methods and Procedures

The use of machine processing procedures facilitated preparation of certain of the appendixes to this report. Ground water level data, and ground water quality data were punched onto cards, tabulated, checked, and in certain cases statistics were calculated by a digital computer. In connection with these procedures, it was necessary to adopt coding or numbering systems to designate hydrologic units in which these data appeared and also for the identification of the specific data. These coding systems are described in the following paragraphs.

Hydrologic Area Coding System

In the report series preceding the Bulletin No. 130 series, the procedure for the definition of areas was to use ground water basins, listing them by a decimal numbering system. Because of widespread use of boundaries for areas based on different criteria and the necessity for filing data from hydrologic stations not located on ground water basins,

much confusion ensued regarding just what area was being discussed, and much additional work on the part of hydrologists was required to assemble data for the particular area being considered. Accordingly, an areal designation system was developed which would provide uniform boundaries of geologic and hydrologic significance for utilization in departmental investigations. A system of coding was also developed that would better relate areas of interconnecting hydrologic significance to facilitate the filing, separation and recovery of basic data by machine methods, and at the same time provide a basis for a coding procedure that would have statewide application. For these reasons, a new system for designating areas for data filing and retrieval was developed for Southern California. The system is described in a DWR Office Report entitled "Names and Areal Code Numbers of Hydrologic Areas in the Southern District", dated April 1964. The data in this Volume V are filed according to the new system of areal designation, which is briefly described here. Tables that cross-reference the new system to the old system are included as Attachments 1 through 6. They are bound at the back of this report.

The areal designation system for the Southern District comprises a series of major drainage provinces which are further subdivided into hydrologic units, hydrologic subunits, and hydrologic subareas. The boundaries of the drainage provinces are shown on Plate 1, "Drainage Province Boundaries".

Boundaries and Definitions. A drainage province is a geographic area, generally equivalent in area and configuration to the water pollution control board regions as defined in Chapter 4, Division 7, of the State Water Code, except that all province boundaries are drainage divides.

A hydrologic unit meets one or the other of the following descriptions, the boundaries of which are defined by surface drainage divides:

1. In general, the total watershed area, including water-bearing and nonwater-bearing formations, such as the total drainage area of the San Diego River Valley;
2. In coastal areas, two or more small contiguous watersheds having similar hydrologic characteristics, each watershed being directly tributary to the ocean and all watersheds emanating from one mountain body located immediately adjacent to the ocean: or
3. In desert areas, a closed drainage area with a difference in elevation between valley floor and lowest point on the drainage divide of 40 feet or more.

A hydrologic subunit is a major logical subdivision of a hydrologic unit, including water-bearing and nonwater-bearing formations, best typified by a major tributary of a stream, a major valley or a plain along a stream containing one or more ground water basins and having closely related geologic, hydrologic, and topographic characteristics.

Subunit boundaries are based primarily on drainage boundaries. However, where strong subsurface evidence indicates that a division of ground water exists, the subunit boundary may be based on subsurface characteristics.

Although political boundaries usually have no hydrologic significance, they may be used as subunit boundaries when they have legal status with respect to water supply, or there is very strong local custom regarding use of the boundary. For example, the Los Angeles-Orange county line, which has historically been considered to be the southeastern boundary of the Coastal Plain of Los Angeles County, was deemed important enough to prompt its adoption as a subunit boundary, although hydrologically, geologically, and topographically, there is no reason to do so.

A hydrologic subarea is a logical subdivision of a hydrologic subunit which may include either water-bearing or nonwater-bearing formations or both. Where possible, a hydrologic subarea includes one known ground water basin* and its tributary area. In areas which are essentially nonwater-bearing, the subarea division was based only on surface drainage conditions, and such factors as locations of gaging stations were given due consideration.

Variations from Previous Coding Systems. It should be noted that the areal designation system, described here, is designed to separate data according to areas of hydrologic significance. However, the system, as developed, does not differentiate between ground-water-bearing formations

*A ground water basin consists of an area underlain by permeable materials, the basin including both the surface area and the underlying permeable materials. The permeable materials must be generally capable of furnishing a water supply to wells of moderately heavy draft, i.e. must be water-bearing. Ground water basins are separated from each other, or may be subdivided into ground water subbasins, by the following features and conditions, listed in approximate order of desirability as boundaries; nonwater-bearing rock, constriction in permeable materials, fault, zone of low permeability or of change to lower permeability, topographic ridge, shoreline of a lake, political boundary, or ground water divide.

and nonground-water-bearing tributary areas. The boundaries of ground-water-bearing formations are delineated on master quadrangle sheets in the Southern District Office. Furthermore, forebay areas of a ground water basin were not separated from the rest of the basin. For instance, the Los Angeles Forebay Area, the Montebello Forebay Area, and the Central Coastal Plain Pressure Area were combined into a single hydrologic subarea. Similarly, the Mound Pressure Area, the Oxnard Forebay Area, and the Oxnard Plain Pressure Area were combined into a single hydrologic subarea.

In connection with the development of this areal designation system, a review was made of desert areas in the Lahontan and Colorado River Basin Drainage Provinces which revealed numerous closed drainage basins, or sinks, whose valley floors are slightly lower than the lowest point on their drainage divides. In many instances flood runoff, however infrequent, could fill the lower portions of these basins and they would become tributary to adjacent basins. After a careful evaluation of this situation, it was concluded that in these cases a minimum difference of 40 feet between valley floor and drainage divide should be the criterion for the definition of a hydrologic unit.

The eight islands off the Southern California coast were incorporated within drainage provinces according to the county to which the island belongs. The three Santa Barbara County islands (San Miguel, Santa Rosa, and Santa Cruz) were grouped as the Santa Barbara Channel Islands Hydrologic Unit and included within the Central Coastal Drainage Province, while the two Ventura County islands (Anacapa and San Nicolas) and the three Los Angeles County islands (Santa Barbara, Santa Catalina, and San Clemente) were grouped as the San Pedro Channel Islands Hydrologic

Unit and included within the Los Angeles Drainage Province. Each island was made a hydrologic subunit so that it could be subdivided into hydrologic subareas in the future.

Strict adherence to the foregoing definitions, which are based on drainage areas, required some deviation from the historically used system of Water Quality Investigations Report No. 3, "Ground Water Basins in California", November 1952. Drainage province boundaries in the Southern District, however, match regional water pollution control board boundaries, with the exception of the boundary between Water Pollution Control Board Regions Nos. 4 and 8 which uses the Los Angeles-Orange and Los Angeles-San Bernardino county line, while the boundary between Los Angeles and Santa Ana Drainage Provinces uses the drainage divide between the San Gabriel and Santa Ana River systems. In cases where a ground water basin is so located as to be in two adjacent hydrologic units due to drainage boundary considerations, each of the two parts was given subarea status so that, although the data are filed separately, they may be easily combined by machine. An example of this is the Pomona Ground Water Basin, which was split by the boundary line of Los Angeles and Santa Ana Drainage Provinces and resulted in two subareas.

Areal Designation Code. As stated previously, a principal purpose of the areal designation system is the arrangement and coding of basic data to facilitate machine handling. The code developed for this is in the form A-11.A1, consisting of two alphabetical characters and three digits. The alphabetic designations were adopted to permit the expansion of these spaces beyond ten digits while retaining the five-item code.

The alphabetical character to the left of the dash refers to the drainage province which corresponds to the regional water pollution control board boundaries, with the exception of the Los Angeles-Orange and Los Angeles-San Bernardino county boundaries. Drainage province designations and the corresponding water pollution control board region designations are as follows:

	Drainage Province Designation	Water Pollution Control Board Region Designation
Central Coastal	T	3
Los Angeles	U	4
Lahontan	W	6
Colorado River Basin	X	7
Santa Ana	Y	8
San Diego	Z	9

The last letters of the alphabet were used for the data in the southern portion of the State.

The final four positions of the areal designation code comprise two digits to the left of the decimal, which refer to the hydrologic unit, and one alphabetical character and one numerical digit to the right of the decimal, which refer to the hydrologic subunit and hydrologic subarea, respectively. The following is a sample of this code:

Areal Designation	Code
Los Angeles Drainage Province	U-00.00
Los Angeles-San Gabriel River Hydrologic Unit	U-05.00
Coastal Plain of Los Angeles County Hydrologic Subunit	U-05.A0
Palos Verdes Hydrologic Subarea	U-05.A1

West Coast Hydrologic Subarea	U-05.A2
Santa Monica Hydrologic Subarea	U-05.A3
Hollywood Hydrologic Subarea	U-05.A4
Central Hydrologic Subarea	U-05.A5
San Fernando Hydrologic Subunit	U-05.B0
San Fernando Hydrologic Subarea	U-05.B1
Sylmar Hydrologic Subarea	U-05.B2
Tujunga Hydrologic Subarea	U-05.B3
Verdugo Hydrologic Subarea	U-05.B4
Eagle Rock Hydrologic Subarea	U-05.B5

Attachments 1 through 6 list the code associated with each hydrologic subunit in Southern California along with name and number of the previously designated ground water basins.

Station Numbering Systems

In addition to the coding procedure to define areas of hydrologic significance within Southern California, it is necessary to identify each item of hydrologic information in order to provide for its analysis. The designation of several types of data is done simply by the name of the station, such as reservoirs in the case of storage data, agencies in case of water import and sewage export data, and at the present time both surface water stations and precipitation stations also have a common name designating or identifying the station. However, for filing and analysis, it has become convenient to identify these hydrologic data collection stations with their particular numbering system. This is imperative when large masses of data are involved.

The following is a description of station number systems used in this report.

Precipitation Station Numbering System. As used in this report, precipitation stations are identified by their latitude and longitude supplemented by the name of the station. A list of the stations used in this report, together with other data, are given in Appendix A.

Well Numbering System. The state well numbering system used in this report is based on township, range, and section subdivision of the Public Land Survey. It is the system used in all ground water investigations and for numbering all wells for which data are published or filed by the Department of Water Resources. In this report the number of a well, assigned in accordance with this system, is referred to as the state well number.

Under the system, each section is divided into 40-acre tracts lettered as follows:

D	C	B	A
E	F	G	H
M	L	K	J
N	P	Q	R

Note that I and O are omitted in the grid above.

Wells are numbered within each 40-acre tract according to the chronological sequence in which they have been assigned state well numbers.

For example, a well which has the number 16N/3E-17K1, M would be in Township 16 North, Range 3 East, Section 17, Mount Diablo Base and Meridian, and would be further designated as the first well assigned a state well number in tract K. Well numbers are referenced to the Mount Diablo Base and Meridian (M) or the San Bernardino Base and Meridian (S).

Surface Water Station Number System. In addition to the common terminology for a hydrologic data collection station on a body of surface water, such as the name of the stream and its place on the stream or the name of a reservoir, there are two commonly used numerical systems for identifying surface water hydrologic data collection stations.

The first system is a six-digit number used to identify stream-gaging stations, which system is based on a hydrologic area numbering concept. The first digit is an alphabetical designation for the hydrographic area; the second digit is a number and indicates the river basin; the third, a number, designates the reach of the stream; and the last three digits are sequence numbers which are assigned to the stations. The sequence numbers start at the downstream end of the reach and increase in the upstream direction. A list of these stations for which data are published is included in Appendix B, "Surface Water Flow".

The other system used to identify stations for the collection of surface water quality data is an arbitrary one consisting of two digits which define a particular surface water sample station. This system was started by the State Water Pollution Control Board in April 1951. Both number systems are supplemented by the name of the station. A list of stations for which data are published here and a map showing their locations are included in Appendix D.

Definition of Seasons

Reference is made to a number of periods or seasons in the description of water supply conditions presented in the ensuing chapters of this report. Because the time span for each of these periods or seasons depends upon the type of data being accumulated, the periods are defined in the following paragraphs.

Precipitation

Precipitation data cover the 12-month period, July 1 through June 30. This conforms to standard United States Weather Bureau practice.

Surface Runoff

Surface runoff data are compiled for the water year, which is the 12-month period of October 1 through September 30. Artificial recharge and imported water data are also related to this period.

Sewage Disposal

Because of local practice, sewage disposal data are reported for the 12-month period, July 1 through June 30.

Reservoir Storage

The quantity of water in storage in surface reservoirs having individual capacities in excess of 10,000 acre-feet is given as of October 1 of each year.

Ground Water Levels

The appendixes to this report contain ground water level data for the period July 1, 1962, through June 30, 1963. Because ground water levels are generally lowest in the fall (following the summer period of

heaviest extraction) and highest in the spring (following the winter period of recharge and reduced extractions), the fall and spring measurements of ground water elevations are considered to be the most significant and the most representative of the actual conditions of the ground water reserves. For this reason, most comparative measurements are made in the spring and the fall.

Prior Reports

One of the reports that the Bulletin No. 130 series has superseded is the Bulletin No. 39 series, entitled "Records of Ground Water Levels at Wells". The first one was published in 1932 as a part of the investigation initiated by Chapter 832, Statutes of 1929. Since then, water levels at selected wells have been published annually in Bulletins Nos. 39-A through 39-W, and Bulletins Nos. 39-56 through 39-62. Bulletin No. 39-56, the first of the numbered series, followed Bulletin No. 39-W without interruption in the annual continuity of data. This Bulletin No. 130-63 also follows Bulletin No. 39-62 without interruption in the annual continuity of data and inaugurates a more extensive compilation of hydrologic data.

Bulletins Nos. 65 and 66 commenced with reports covering the 1955-56 period and these reports continued through the publication of Bulletin No. 65-62, dated April 1965, and Bulletin No. 66-62, dated September 1964. The Bulletin No. 130 series succeeds the Bulletins Nos. 65 and 66 series without a break in the continuity of the data.

Since 1930, many bulletins covering various aspects of the hydrology of Southern California have been published by the Department of

Water Resources and its predecessor, the Division of Water Resources of the Department of Public Works. These bulletins include data on water use, ground water levels, quality of water, value and cost of water for irrigation, water losses and evaporation data, ground water geology, and evaluation of overdraft on ground water basins in Southern California.

In addition, water conditions reports are prepared by the Department of Water Resources as of the first of each month from February through May as the annual Bulletin No. 120 series. These reports contain forecasts of the anticipated runoff for the ensuing April to July snowmelt period. The May 1 report contains a section on ground water conditions as of the date of the report.

Contemporary Basic Data Reports

This report is one of several related reports issued annually by the Department of Water Resources, designed primarily to publish basic hydrologic data and to present discussions of water supply conditions. Concurrent reports, not all of which are published annually, are listed below. The year indicated is that of the latest publication.

Bulletin No.	
23-61	"Surface Water Flow for 1961". August 1963.
65-62	"Quality of Surface Waters in California, 1961". April 1965.
66-62	"Quality of Ground Waters in California, 1961-1962, Part II, Southern California". September 1964.
68-62	"Reclamation of Water from Sewage and Industrial Wastes in California, July 1, 1955 - June 30, 1962". June 30, 1962.
73	"Evaporation from Water Surfaces in California". October 1959.

77-60 "Ground Water Conditions in Central and Northern California; 1959-60", January 1963

91- 1 "Data on Wells in the West Part of the Middle Mojave Valley Area, San Bernardino County, California", June 1960

91- 2 "Data on Water Wells and Springs in the Yucca Valley-Twenty-nine Palms Area, San Bernardino and Riverside Counties, California", June 1960

91- 3 "Data on Water Wells in the Eastern Part of the Middle Mojave Valley Area, San Bernardino County, California", August 1960

91- 4 "Data on Water Wells in the Willow Springs, Gloster, and Chaffee Areas, Kern County, California", August 1960

91- 5 "Data on Water Wells in the Dale Valley Area, San Bernardino and Riverside Counties, California", March 1961

91- 6 "Data on Wells in the Edwards Air Force Base Area, California", June 1962

91- 7 "Data on Water Wells and Springs in the Chuckwalla Valley Area, Riverside County, California", May 1963

91- 8 "Data on Water Wells and Springs in Rice and Vidal Valley Areas, Riverside and San Bernardino Counties, California", May 1963

91- 9 "Data on Water Wells in Indian Wells Valley Area, Inyo, Kern, and San Bernardino Counties, California", May 1963

91-10 "Wells and Springs in the Lower Mojave Valley Area, San Bernardino County, California", December 1963

Definition of Terms

A list of definitions and terms as used herein follows:

Second-foot or cubic foot per second is a unit rate of discharge of water. It is a cubic foot of water passing a given point in one second.

Acre-foot, used in measuring the volume of water, equals the quantity of water required to cover one acre to a depth of one foot, 43,560 cubic feet or 325,850 gallons.

Drainage area of a stream at a specified location is that area which is enclosed by a drainage divide.

Unimpaired runoff is the flow that would occur naturally at a point in a stream if there were: (1) no upstream control such as dams and reservoirs; (2) no artificial diversions or accretions; and (3) no changes in ground water storage resulting from development. Unimpaired runoff is computed from measured flow allowing for man-made changes in natural conditions.

Water year is the 12-month period from October 1 of any year through September 30 of the subsequent year, and is designated by the calendar year in which it ends.

Mean is the average of a group of items obtained by adding together all items and dividing by the total number of items used.

Isohyetal line is a line connecting points of equal precipitation.

CHAPTER III. CLIMATE

As was pointed out earlier, the 1962-63 season was generally one of subnormal precipitation in most of Southern California. This was in marked contrast to the above average rainfall of the previous season. Further manifestations of this condition were the low runoff and decreased storage in those surface reservoirs storing only local waters, except in the Owens Valley area. The following pages discuss the precipitation situation in Southern California during the 1962-63 season.

Precipitation

Precipitation in coastal Southern California varied from slightly above normal in San Luis Obispo County, diminishing gradually in a southerly direction, as indicated in Table 1, to a minimum of 38 percent at San Diego. In the desert areas, it was well below normal, whereas in Inyo County, it was about normal. The general distribution of precipitation during the 1962-63 season is shown on Plate 2, "Precipitation During 1962-63 in Percent of 50-Year Mean Precipitation". It should be noted that Figure 2 is based upon water year, whereas Plate 2 is based upon fiscal year.

Plate 3, "Representative Precipitation Characteristics in Southern California", gives an indication of the effect of the 1962-63 season at selected stations on the long-range water supply. From this plate, it may be seen that, while above normal precipitation occurred in the extreme northern portion of coastal Southern California, the overall picture is one of extreme drought. The total precipitation that accumulated during the 19-year period of deficiency which began in 1944, approximates the precipitation of two to three normal years.

TABLE 1

SEASONAL AND MEAN PRECIPITATION AT
SELECTED STATIONS IN SOUTHERN CALIFORNIA

Station	County	50-year mean, 1897-1947, in inches	1962-63 season	
			In inches	In percent of mean
		Coastal		
Paso Robles	San Luis Obispo	15.82	17.09	108
San Luis Obispo	San Luis Obispo	21.68	24.80	114
Santa Maria	Santa Barbara	13.52	11.71	87
Santa Barbara	Santa Barbara	18.56	15.73	85
Ventura	Ventura	15.59	10.73	69
Los Angeles	Los Angeles	14.81	8.38	57
Pomona	Los Angeles	18.21	9.67	53
Santa Ana	Orange	14.16	5.89	42
San Bernardino	San Bernardino	17.21	8.31	48
Oceanside	San Diego	12.38	5.90	48
San Diego	San Diego	10.36	3.98	38
		Interior		
Bishop	Inyo	6.14	6.10	99
Barstow	San Bernardino	4.17	.96	23
Blythe	Riverside	4.03	1.83	45
Brawley	Imperial	2.40	1.37	57

Table 2 indicates the cumulative monthly precipitation at selected stations in Southern California. Note that the three stations in coastal Southern California receive most of their seasonal rainfall during the winter months, whereas the desert station at Barstow receives precipitation in a relatively more uniform sequence during the season.

Central Coastal Drainage Province (T),
(Santa Barbara and San Luis Obispo Counties)

Precipitation data for those hydrologic units or subunits in the San Luis Obispo and Santa Barbara portions of the Central Coastal

TABLE 2

CUMULATIVE MONTHLY PRECIPITATION
AT SAN LUIS OBISPO, LOS ANGELES,

Drainage Province are presented in Table 3; the location of the units is shown on Plate 4, "Location of Wells at Which Water Level Fluctuations are Shown, Central Coastal Drainage Province (T)".

TABLE 3

AVERAGES OF INDEXES OF PRECIPITATION FOR STATIONS IN HYDROLOGIC UNITS IN CENTRAL COASTAL DRAINAGE PROVINCE FOR THE 1962-63 SEASON

Hydrologic unit or subunit	Code	Number of stations	Average index
Paso Robles Hydrologic Subunit	T-09.H0	7	86
San Luis Obispo Hydrologic Subunit	T-10.B0	3	98
Carrizo Plain Hydrologic Unit	T-11.00	1	79
Santa Maria Hydrologic Subunit	T-12.A0	1	87
Sisquoc Hydrologic Subunit	T-12.B0	1	75
Cuyama Valley Hydrologic Subunit	T-12.C0	1	59
San Antonio Hydrologic Unit	T-13.00	2	82
Lompoc Hydrologic Subunit	T-14.A0	1	80
Santa Ynez Hydrologic Subunit	T-14.D0	1	63
Headwater hydrologic Subunit	T-14.E0	3	65
Arguello Hydrologic Subunit	T-15.A0	2	70
South Coast Hydrologic Subunit	T-15.C0	3	89
Central Coastal Drainage Province, San Luis Obispo and Santa Barbara Counties	T	26	78

Precipitation in this area varied from a minimum of 59 percent of the mean for the 50-year period 1897-98 through 1946-47 in the Cuyama Valley Hydrologic Subunit to a maximum of 98 percent of the mean in the San Luis Obispo Hydrologic Subunit. In general, the precipitation indexes are somewhat higher in San Luis Obispo County than they are in Santa Barbara County with the City of San Luis Obispo recording 24.80 inches for an index of 114 while the City of Santa Barbara had only 15.73 inches for an index of 85. The average of precipitation indexes for the 26 stations in the province was 78 percent of the mean.

There were no reports of weather modification activities in this province during the 1962-63 water year.

Los Angeles Drainage Province (U)

In the Los Angeles Drainage Province, the average precipitation index for the 1962-63 season was 57 percent of the 50-year mean, 1897-98 through 1946-47 as shown in Table 4. The average areal precipitation index

TABLE 4

AVERAGES OF INDEXES OF PRECIPITATION FOR STATIONS IN HYDROLOGIC UNITS IN LOS ANGELES DRAINAGE PROVINCE FOR THE 1962-63 SEASON

Hydrologic unit or subunit	Code	Number of stations	Average index
Lower Ventura River Hydrologic Subunit	U-02.A0	3	68
Upper Ventura River Hydrologic Subunit	U-02.B0	5	71
Ojai Hydrologic Subunit	U-02.C0	5	56
Oxnard Plain Hydrologic Subunit	U-03.A0	6	61
Santa Paula Hydrologic Subunit	U-03.B0	6	58
Sespe Hydrologic Subunit	U-03.C0	7	65
Piru Hydrologic Subunit	U-03.D0	5	56
Upper Santa Clara River Hydrologic Subunit	U-03.E0	21	45
Calleguas-Conejo Hydrologic Subunit	U-03.F0	11	64
Topanga Hydrologic Subunit	U-04.A0	1	61
Malibu Creek Hydrologic Subunit	U-04.B0	1	78
Camarillo Hydrologic Subunit	U-04.D0	1	71
Coastal Plain of Los Angeles County Hydrologic Subunit	U-05.A0	55	67
San Fernando Hydrologic Subunit	U-05.B0	44	52
Raymond Hydrologic Subunit	U-05.C0	24	53
San Gabriel Valley Hydrologic Subunit	U-05.D0	43	48
Spadra Hydrologic Subunit	U-05.E0	7	56
Anaheim Hydrologic Subunit	U-05.F0	11	59
Los Angeles Drainage Province	U	256	57

for the units and subunits (shown on Plate 5, "Location of Wells at Which Water Level Fluctuations are Shown, Los Angeles Drainage Province (U)") within the province ranged from a low of 45 percent in the Upper Santa Clara River Hydrologic Subunit in Los Angeles County to a high of 78 percent in Malibu Creek Hydrologic Subunit in coastal Los Angeles County. Precipitation, as measured at the U. S. Weather Bureau Station located

atop the Federal Building in downtown Los Angeles, amounted to 8.38 inches, or 57 percent of the 50-year mean, which was 45 percent of the previous year's precipitation.

Weather modification operations were conducted by the Los Angeles County Flood Control District in the drainage area above San Gabriel Dam where ground-based silver iodide smoke generators were operated for a total of 602 hours during the season.

Lahontan Drainage Province (W), (Southern Portion)

In the Lahontan region, precipitation indexes were on the same order as those for the rest of Southern California, varying from a minimum of 23 percent of the mean in the Lower Mojave Hydrologic Unit to a high of 98 percent in Deep Springs Unit, as presented in Table 5. The locations of the units are shown on Plate 6, "Location of Wells at Which Water Level Fluctuations are Shown, Lahontan Drainage Province (W)". It is noted that

TABLE 5

AVERAGES OF INDEXES OF PRECIPITATION FOR STATIONS IN HYDROLOGIC UNITS IN LAHONTAN DRAINAGE PROVINCE FOR THE 1962-63 SEASON

Hydrologic unit or subunit	Code	Number of stations	Average index
Mono Hydrologic Unit	W-01.00	3	95
Upper Owens Hydrologic Subunit	W-03.B0	8	40
Lower Owens Hydrologic Subunit	W-03.C0	7	55
Deep Springs Hydrologic Unit	W-05.00	1	98
Searles Hydrologic Subunit	W-21.A0	1	39
Rose Hydrologic Subunit	W-24.A0	1	62
Indian Wells Hydrologic Subunit	W-24.B0	1	45
Antelope Hydrologic Subunit	W-26.A0	34	40
El Mirage Hydrologic Subunit	W-28.A0	1	28
Upper Mojave Hydrologic Subunit	W-28.B0	4	42
Lower Mojave Hydrologic Subunit	W-28.E0	1	23
Baker Hydrologic Subunit	W-28.H0	1	72
Lahontan Drainage Province	W	63	46

the pattern for this area is similar to that along the coast with the higher precipitation index values found in the more northern hydrologic units.

No weather modification activities were reported for the 1962-63 season in the Lahontan Drainage Province.

Colorado River Basin Drainage Province (X)

The average precipitation index for this province for the 1962-63 season was 47 percent of the 50-year mean 1897-98 through 1946-47, as shown on Table 6. The maximum precipitation index for this area was observed in the Ward Hydrologic Unit with minimums being recorded in the Needles and Coyote Wells Subunits. The locations of the units are shown on Plate 7, "Location of Wells at Which Water Level Fluctuations are Shown, Colorado River Basin Drainage Province (X)".

TABLE 6

AVERAGES OF INDEXES OF PRECIPITATION FOR STATIONS IN HYDROLOGIC UNITS IN COLORADO RIVER BASIN DRAINAGE PROVINCE FOR THE 1962-63 SEASON

Hydrologic unit or subunit	Code	Number of stations	Average index
Emerson Hydrologic Unit	X-05.00	1	39
Twentynine Palms Hydrologic Subunit	X-09.A0	1	44

Mescal Bajada Hydrologic Subunit	X-22.C0	1	51
Imperial Hydrologic Subunit	X-23.A0	5	42
Coyote Wells Hydrologic Subunit	X-23.B0	1	32
Colorado River Basin Drainage Province	X	35	47

There were no reports of weather modification activities in this province during the 1962-63 season.

Santa Ana Drainage Province (Y)

Precipitation was generally uniform throughout this province in terms of the percentage of the 50-year mean, which was 47 percent for the 1962-63 season. Available data indicate a minimum index of 30 percent at the Lake Mathews Hydrologic Subunit, with a maximum index of 55 percent being recorded in the San Bernardino Mountain Hydrologic Subunit. The average indexes of precipitation for stations within the Santa Ana Drainage Province are shown in Table 7, with the location of the units shown on Plate 8, "Location of Wells at Which Water Level Fluctuations are Shown, Santa Ana Drainage Province (Y)". Measured seasonal precipitation at the U. S. Weather Bureau Stations in Santa Ana and San Bernardino amounted to 5.89 and 8.31 inches, respectively, or 42 and 48 percent of the mean.

TABLE 7

AVERAGES OF INDEXES OF PRECIPITATION FOR STATIONS IN HYDROLOGIC UNITS IN SANTA ANA DRAINAGE PROVINCE FOR THE 1962-63 SEASON

Hydrologic unit or subunit	Code	Number of stations	Average index
Lower Santa Ana Hydrologic Subunit	Y-01.A0	27	49
Middle Santa Ana Hydrologic Subunit	Y-01.B0	24	46
Lake Mathews Hydrologic Subunit	Y-01.C0	3	30
Colton-Rialto Hydrologic Subunit	Y-01.D0	10	47
Upper Santa Ana Hydrologic Subunit	Y-01.E0	9	50
San Timoteo Hydrologic Subunit	Y-01.F0	1	45
San Bernardino Mountain Hydrologic Subunit	Y-01.G0	1	55
Perris Hydrologic Subunit	Y-02.A0	1	48
San Jacinto Hydrologic Subunit	Y-02.B0	3	49
Elsinore Hydrologic Subunit	Y-02.C0	1	47
Santa Ana Drainage Province	Y	80	47

Weather modification operations were conducted by the San Bernardino Valley Municipal Water District in the Santa Ana River watershed during the 1962-63 season. A total of 1,349 hours of operation was logged, using ground-based silver iodide smoke generators.

San Diego Drainage Province (Z)

Precipitation index in the San Diego Drainage Province was below normal for the fifth year in a row and the fifteenth since the present drought period began in 1944. The precipitation index for this province for the 1962-63 season was 45 percent. It will be noted from data presented in Table 8 that the areal average precipitation indexes ranged from a low of 28 percent in the Point Loma Hydrologic Subunit in the southern end of the province to a high of 63 percent in the Laguna Hydrologic Subunit situated on the coast in the northern extremities. The location of these units is shown on Plate 9, "Locations of Wells at Which Water Level Fluctuations are Shown, San Diego Drainage Province (Z)". Measured seasonal precipitation at the City of San Diego was only 3.98 inches, or 38 percent of the mean. The precipitation at San Diego during February 1963 was the smallest ever recorded during February for the 113 years of historical records. February is normally in the middle of the rainy season.

Weather modification operations were conducted by the Vista Irrigation District in the watershed of the San Luis Rey River above Lake Henshaw, where ground-based silver iodide smoke generators were operated for a total of 245 hours during the season.

Data Collection Activities

The data collection activities of the Department of Water Resources in the field of climatology are composed of operation of stations in relation to the State Water Facilities. In this regard, the Department operates and maintains climatological stations in the vicinity of proposed reservoirs in Southern California and has enlisted the

cooperation of local agencies in assisting the Department in these efforts. The Department also collects and compiles data obtained by federal and local agencies, constituting by far the major part of the data. In addition, the Department of Water Resources has purchased meteorological equipment which is on loan to local governmental agencies for the collection of meteorological data by local personnel, providing for the completion of networks for climatological data collection.

CHAPTER IV. SURFACE WATER FLOW

Runoff in Southern California was generally far below normal during the 1962-63 water year, with the exception of the Owens River where 94 percent of the mean runoff below Long Valley was recorded. This situation in the Sierras was due, in part, to the late precipitation of the previous season and near normal precipitation for the current season in the Long Valley-Mono Lake area. Of particular concern is the San Diego Drainage Province where runoff in percent of the long-term mean approached the all-time low of the 1960-61 season.

This chapter discusses not only runoff but also discharge of surface water to the ocean, storage in surface reservoirs, Colorado River diversions, other imported water, and sewage discharge to the ocean. It concludes with details on the data collection activities of the Department.

Runoff

The estimated unimpaired runoff (runoff unaffected by the works of man) for selected stations representative of conditions in Southern California is presented in Table 9, together with a comparison of the mean for the 53-year period, 1894-95 through 1946-47. Estimated or measured maximum and minimum flows for each station during the period of record are also indicated.

Typical of most streams in coastal Southern California was the Arroyo Seco near Pasadena where the measured unimpaired runoff was 25 percent of normal. The measured flow of the Colorado River at Lee's Ferry, Arizona, uncorrected for upstream storage or diversion, was 6,268,000 acre-feet, or 53 percent of the average for the 34-year period 1922-23 through

a. Mean for period 1894-95 through 1946-47, except as noted.
b. Indicated maxima and minima are recorded or estimated values for period 1894-95 to date except as noted.
c. Measured runoff, unadjusted for upstream development.
d. Huasna River, Arroyo Grande 53-year mean computed from Santa Maria Station.
e. Zero flow reported for eleven seasons.
f. Average for period 1920-21 through 1949-50.
g. Indicated maxima and minima are recorded or estimated values for a given period of record.
h. Average for period 1922-23 through 1955-56.
j. Average for period 1936-37 through 1955-56.
k. Average for period 1930-31 through 1940-41 and 1947-48 through 1957-58.

1955-56. This was approximately 8,000,000 acre-feet less than the previous year, a portion of which can be accounted for by the retention of water behind Glen Canyon Dam in Lake Powell which started filling in January 1963 and, as of October 1, 1963, contained 2,535,000 acre-feet.

Historical unimpaired runoff and the accumulated deviation from the mean seasonal unimpaired seasonal runoff for four selected streams for the period 1894 to the present are delineated on Plate 10, "Representative Runoff Characteristics in Southern California".

Because most runoff of water from the forested watersheds in Southern California is trapped behind dams for later release to spreading grounds, the discharge to the ocean is held at a minimum and is composed primarily of runoff from urban areas on the coastal plains. Runoff from these areas is not economically susceptible to interception. Waste from industries is also discharged to the Pacific Ocean.

Table 10 presents data for the 1962-63 season on discharge from the larger streams which drain a major portion of coastal Southern California. For comparison, flow data for the preceding year are also included in the table. This discharge is in general directly responsive to precipitation. The discharge during the 1962-63 season was no exception to the general trend since 1945 and is a further manifestation of the below-normal precipitation.

Storage in Surface Reservoirs

The amount of water in storage in selected reservoirs as of October 1, 1963, in or supplying water to Southern California is presented in Table 11. So that a comparison can be made, the storage as of October 1 of the previous year is also presented.

a. Component of the aqueduct system of the City of Los Angeles.
b. Includes Colorado River water imported via Colorado River Aqueduct.
c. Includes Colorado River water imported via Colorado River Aqueduct and San Diego Aqueduct.

or 23 percent of total capacity. This is approximately 35,000 acre-feet less than that in storage on October 1, 1962. Reservoirs storing either imported water or a mixture of imported and local waters, including the Owens Aqueduct system, contained 518,500 acre-feet of water, or 70 percent of capacity, on October 1, 1963, compared to 370,000 in storage on October 1, 1962. This increase is due both to the enlargement of Lake Mathews where an increase in storage of approximately 80,000 acre-feet was indicated and an increase in the amount of storage of 53,000 acre-feet in Lake Crowley on the Owens River.

In San Diego County, the total water in storage as of October 1, 1963, amounted to 87,400 acre-feet, or 12 percent of total storage capacity. This was an increase of only 3,000 acre-feet of water despite an importation and storage of 228,800 acre-feet of Colorado River water during the 1962-63 water year.

Those reservoirs in the Owens Valley belonging to the City of Los Angeles Department of Water and Power contained a total of 251,000 acre-feet of water on October 1, 1963, or 87 percent of capacity. This compares to 174,000 acre-feet in storage on October 1 of the previous year.

Waters stored in the major reservoirs of the lower Colorado River, including Lake Powell, amounted to 21,853,000 acre-feet as of October 1, 1963. This was 14 percent less than the amount of water stored in these reservoirs on October 1, 1962.

Water Imported to Coastal Southern California

Water imported to Southern California by both the City of Los Angeles Department of Water and Power and The Metropolitan Water District of Southern California during the 1962-63 season totaled

1,365 764 acre-feet which represents an increase of 20 868 acre-feet over that imported during the previous year. Plate 11, "Historical Importations of Water to Coastal Southern California", graphically presents these importations.

Deliveries of water through the Colorado River Aqueduct as measured at the Hayfield Pumping Plant, which is located approximately 125 miles west of the intake at Lake Havasu, were 1,054,222 acre-feet for the 1962-63 water year, an increase of 4 percent from the 1961-62 season. Deliveries of water to member agencies of The Metropolitan Water District of Southern California totaled 964,540 acre-feet during the water year, a decrease of about 3 percent over the previous year. Data for the 1961-62 and 1962-63 water year deliveries of Colorado River water to each of the coastal counties are presented in Table 12. The difference in the values for the volume of water measured at the Hayfield Pumping Plant and the sum

TABLE 12

COLORADO RIVER WATER IMPORTED TO COUNTIES
IN COASTAL SOUTHERN CALIFORNIA
DURING 1961-62 AND 1962-63 WATER YEAR

County	Seasonal import, in acre-feet		Percent change
	1961-62	1962-63	
Los Angeles	464,100	379,684	-18
San Diego	187,630	228,839	+22
Orange	291,020	294,687	+ 1
Riverside	41,140	52,602	+28
San Bernardino	6,520	8,728	+34
TOTALS	990,410	964,540	- 3

of the deliveries to the various counties shown in Table 12 is accounted for primarily by change of storage in Lake Mathews. Distribution system losses are also contributing factors.

The Department of Water and Power of the City of Los Angeles imported a total of 311,542 acre-feet of water through its aqueduct system from Owens Valley. The aqueduct was operated at full capacity during the 1962-63 water year except for short periods of shutdown for maintenance.

Net diversions of water from the Colorado River by principal water agencies in California during the 1963 calendar year amounted to 5,058,646 acre-feet. This is a decrease of 2,834 acre-feet from the volume diverted during the 1962 year. Table 13 presents quantities of water diverted from the Colorado River for use in California by each principal

TABLE 13

QUANTITIES OF WATER DIVERTED FROM
THE COLORADO RIVER FOR USE IN CALIFORNIA
DURING 1962 AND 1963

Agency	Diversion, in acre-feet		Percent change
	1962	1963	
The Metropolitan Water District of Southern California	1,063,060	1,046,190	- 2
Palo Verde Irrigation District	381,180	367,026	- 4

TOTALS	5,061,480	5,058,646	0

agency during the 1962 and the 1963 calendar years. A historical record of net diversions of Colorado River water to California from calendar years 1935 to 1963 is shown graphically on Plate 12, "Net Diversions of Water to California from the Colorado River".

Sewage Discharge to the Pacific Ocean and Tidal Estuaries

Sewage effluent discharged to the Pacific Ocean and tidal estuaries, through 12 outfalls which dispose of essentially all such effluent along the coast, amounted to approximately 800,000 acre-feet during the 1962-63 fiscal year. This is about 2 percent more than that discharged during the previous year. The amount of effluent discharged through each outfall during the 1962-63 season compared with discharges during the 1961-62 season, is shown on Table 14.

The International Outfall Sewer near Tijuana was abandoned on July 10, 1962, and permanently sealed. The sewage from San Ysidro was diverted to the stabilization pond at San Ysidro on July 10, 1962. The sewage from Tijuana was diverted permanently to sewage disposal projects located entirely in Mexico on March 23, 1962.

Data Collection Activities

The extent of streamflow data collection activities by the Department of Water Resources in Southern California is limited to the construction, operation, and maintenance of stream-gaging stations in the vicinity of the State Water Facilities, located on Piru Creek, Castaic Creek, Elizabeth Lake Canyon Creek, and tributaries to the West Fork of the Mojave River. In addition to measurements collected at these stations, incidental measurements of surface water flow are made by Department of

Water Resources personnel from time to time during investigations or emergency situations.

The majority of surface water flow data collection in Southern California is done by the U. S. Geological Survey or local water agencies. A major part of the activities of the Geological Survey in Southern California in the construction, operation, and maintenance of stream-gaging stations for hydrologic data collection is conducted on a cooperative basis between the State of California and the United States, whereby the State of California provides funds on a matching basis to the Geological Survey.

Local agencies in Southern California also obtain streamflow records for operational or hydrologic purposes. Streamflow measurement is published in this series to supplement existing publications of streamflow measurements in Southern California.

CHAPTER V. GROUND WATER SUPPLY CONDITIONS

Ground water levels generally declined in Southern California during the 1962-63 season in continuation of the long-term trend illustrated by the hydrographs on Plates 13A and 13B, "Hydrographs of Ground Water Levels at Selected Wells in Southern California". The decline of water levels in many areas can be attributed to the below-normal precipitation for the season which prevented normal recharge of the ground water supply. Continued overdraft of available ground water supplies was also a factor in many basins.

This chapter deals not only with measurements of ground water levels, but also with the artificial recharge being done in Southern California, and with quality of ground water.

Ground Water Levels

A tabulation of all available ground water level observations for Southern California is given in Appendix C. A brief summary of ground water level changes between the spring of 1962 and the spring of 1963 is presented here for each of the drainage provinces. It should be noted that changes in levels are determined by a simple arithmetic average of available measurements. No attempt has been made to select wells according to the size or importance of the ground water basins involved. Also presented are the observed extremes in depth to ground water and the wells where they occurred.

Central Coastal Drainage Province (T), (Santa Barbara and San Luis Obispo Counties)

Estimated changes in ground water levels for the southern part of the Central Coastal Drainage Province between the spring of 1962 and

the spring of 1963 are given in Table 15. Ground water levels changed 2 feet or less in 20 out of 24 hydrologic areas tabulated. The changes shown that are greater than 2 feet may not be conclusive due to the small number of wells involved.

Los Angeles Drainage Province (U)

Estimated changes of ground water levels for the Los Angeles Drainage Province between the spring of 1962 and the spring of 1963 are given in Table 16. Ground water levels declined in 29 of the 46 hydrologic areas tabulated, 6 remained substantially the same, and 11 increased. The 15-foot rise in the Piru Subarea (U-03.D1) can be attributed to the spreading of local water in the area. Water spreading also accounted for the 7-foot rise shown for the Central Subarea (U-05.A5), except that most of the water spread was imported Colorado River water and that control of pumping was also a factor. The 12-foot rise in the Anaheim Subarea (U-05.F1) was also due mostly to the spreading of imported Colorado River water and control of pumping. The Anaheim Subarea is adjacent to the East Coastal Plain Subarea (Y-01.A1) in the Santa Ana Drainage Province which also showed a rise for the same reasons. Water levels have stabilized in the West Coast Subarea (U-05.A2), reflecting the water injected through a series of injection wells of a sea-water intrusion barrier project. The water level declines shown in a majority of the hydrologic units reflect the subnormal precipitation received during the 1962-63 season throughout this drainage province.

Lahontan Drainage Province (W), Southern Portion

Estimated changes of ground water levels for the southern portion of the Lahontan Drainage Province are given in Table 17.

AVERAGE CHANGES IN GROUND WATER ELEVATIONS
IN HYDROLOGIC UNITS IN LAHONTAN
DRAINAGE PROVINCE DURING 1962-1963
(continued)

Hydrologic unit, subunit, and subarea	Number of wells considered in analysis	Average change in ground water level during the year, in feet	Location and observed extremes of depth to ground water during 1962-63, in feet	
			Maximum	Minimum
W-28.C0 Middle Mojave Subunit	2	- 1	8N/ 1W-32F01S 151.9	8N/ 4W-21F02S 10.3
W-28.E0 Lower Mojave Subunit	4	- 3	10N/ 3E-21A01S 110.6	9N/ 2E- 3G02S 8.0

None of this area has drainage outlets to the ocean, and it has many closed basins, some of which are small. The only source of ground water recharge is precipitation, which is quite low over much of the region. Water-bearing sediments which have major significance are located in the Owens (W-03.00), Antelope (W-26.00), and Mojave (W-28.00) Hydrologic Units. The Owens Unit (W-03.00) sediments receives most of its recharge from runoff from snowmelt in high mountainous area.

Colorado River Basin Drainage Province (X)

Changes of ground water levels for the Colorado River Basin Drainage Province between the spring of 1962 and the spring of 1963 are given in Table 18. Because there is a lack of data for considerable parts of this drainage province, the changes presented may not reflect general conditions. Most of the area drains to the closed Salton Sea Basin. Ground water in this drainage province is of less significance from a water supply standpoint than is imported water from the Colorado River Aqueduct.

Santa Ana Drainage Province (Y)

Changes of ground water levels for the Santa Ana Drainage Province between the spring of 1962 and the spring 1963 are given in Table 19. Ground water levels generally fell, due to a deficiency in precipitation and continued overdraft. In the East Coastal Plain Subarea (Y-01.A1), an average rise of 7 feet was due principally to artificial recharge operations, using mostly imported Colorado River water, and to controlling of pumping. This subarea is adjacent to the Anaheim Subarea (Y-01.A1) in the Los Angeles Drainage Province which also showed a rise

for the same reasons. Other rises shown may not reflect actual conditions due to rapidly fluctuating water levels and timing of measurements.

San Diego Drainage Province (Z)

Changes of ground water levels for the San Diego Drainage Province between the spring of 1962 and the spring of 1963 are given in Table 20. Ground water levels generally fell. Areas showing rises may not reflect actual conditions due to rapidly fluctuating water levels and timing of measurements. Deposits of water-bearing sediments in this drainage province are relatively small in capacity. Some have been observed to have been pumped dry in a single season. During this season, as in previous seasons, the San Diego Drainage Province has been drier than most of the rest of Southern California, with the result that its meager ground water basins have suffered relatively more, and increased reliance is put on imported Colorado River water.

Artificial Recharge

The replenishment of ground water basins by artificial recharge as a means of conserving surface runoff and regulating imported water is widely practiced in Southern California. Approximately 362,000 acre-feet of local and imported water were reported as being spread or injected at 40 ground water recharge projects during the 1962-63 water year. Of these, about 280,000 acre-feet, or 77 percent, consisted of imported Colorado River water. Total water spread was approximately 71 percent of the total amount spread during the 1961-62 water year. Essentially all the imported supply was spread in two areas: Montebello Forebay, which is located in the Central Subarea of the Los Angeles-San Gabriel River Unit and the

Santa Ana Forebay, which is located in the East Coastal Plain Subarea of the Santa Ana River Unit. In the Montebello area, 12,400 acre-feet of reclaimed water were also spread. This water was produced by the Water Reclamation Plant of the County Sanitation Districts of Los Angeles County at Whittier Narrows. The Department's Bulletin No. 80 series of reports describes the reclamation of water from sewage and industrial waters in more detail.

These artificial recharge activities played an important role in increasing the amounts of water stored underground and in retarding the decline of water levels. The measured or estimated amounts of artificial recharge to the underground reservoirs at the various projects during the 1962-63 water year are shown in Table 21.

CHAPTER VI. MISCELLANEOUS ACTIVITIES AFFECTING WATER SUPPLY CONDITIONS

The formation of water districts and construction activities relating to water often affect the water supply conditions in Southern California; for this reason a brief outline of the more important activities that occurred during the 1962-63 water year is presented below.

Construction of Dams

Five dams with impounding capacities greater than 100 acre-feet were completed during the water year. These were Chet Harritt Dam at Lakeside, San Diego County; Encino Dam at Encino, Los Angeles County; Palisades Dam at Capistrano Beach, Orange County; Squires Dam at Agua Hedionda, San Diego County; and Villa Park Dam on Santiago Creek, Orange County. Two additional projects under construction, Alta Loma Dam on Alta Loma Channel, San Bernardino County, and San Joaquin Reservoir Dam on a tributary of Bonita Creek between Big Canyon and Coyote Canyon, Orange County, were incomplete as of September 30, 1963. Table 22 gives the beginning date of construction of the above-mentioned dams, their purpose, capacity in acre-feet, and the agency responsible for the construction.

Water Supply Projects

During the 1962-63 water year The Metropolitan Water District of Southern California was constructing the Robert B. Diemer Filtration Plant near Yorba Linda with an initial capacity of 200 million gallons per day. The plant began operation in December 1963. Preliminary plans were to complete the plant to its ultimate capacity of 400 million gallons per day of softened and filtered water. The District was also preparing

TABLE 22

DAM PROJECTS COMPLETED OR UNDER CONSTRUCTION IN SOUTHERN CALIFORNIA DURING THE 1962-63 WATER YEAR*

Dam project	Construction		Agency responsible for construction	Purpose	Location	Reservoir capacity, in acre-feet
	Started	Completed				
Alta Loma	June 1961	Incomplete	San Bernardino County Flood Control District	Flood control	Alta Loma Channel, San Bernardino County	108
Chet Harritt	April 1961	October 1962	Helix Irrigation District	Terminal storage	Lakeside, San Diego County	10,500
Encino	October 1960	October 1962	Los Angeles Department of Water and Power	Terminal storage	Encino, Los Angeles County	10,300
Palisades	July 1962	August 1963	Tri Cities Municipal Water District	Terminal storage	Capistrano Beach, Orange County	147
San Joaquin	January 1963	Incomplete	Irvine Ranch Water District	Terminal storage	Tributary Bonita Creek, Orange County	3,036
Squires	January 1962	March 1963	Carlsbad Municipal Water District	Terminal storage	Agua Hedionda, San Diego County	600
Villa Park	May 1961	January 1963	Orange County Flood Control District	Flood control and conservation	Santiago Creek, Orange County	15,600

*Greater than 100 acre-feet capacity.

the plans and specifications for the expansion of the softening facilities at the F. B. Weymouth Plant at La Verne. The additional softener units will make it possible for the plant to produce 400 million gallons per day of finished water having an average hardness of 125 parts per million.

Water District Formation Activities

During the 1962-63 fiscal year, The Metropolitan Water District of Southern California annexed five areas. The Upper San Gabriel Valley Municipal Water District was annexed to the Metropolitan Water District, and in Orange County two small areas were concurrently annexed to Coastal Municipal Water District and to Metropolitan. In Riverside County four small areas were concurrently annexed to Eastern Municipal Water District and to Metropolitan. In San Diego County the City of Del Mar was concurrently annexed to San Diego County Water Authority and to the Metropolitan Water District. Also in San Diego County a small fringe area was concurrently annexed to Olivenhain Municipal Water District, to the County Water Authority, and to the Metropolitan Water District. In Ventura County, two small areas were concurrently annexed to Calleguas Municipal Water District and to the Metropolitan Water District.

In addition to the above-noted annexations to major water agencies, the following water districts were formed in Southern California during the 1962-63 fiscal year:

Los Angeles County:	County Water Works District No. 35
	County Water Works District No. 36
	Upper Santa Clara Valley Water Agency
Orange County:	Santiago County Water District

Riverside County:	Murieta County Water District
	Calimesa County Water District
San Bernardino County:	Palm Wells County Water District
	Star Vista County Water District
	Yucca Valley County Water District
	Crestline-Lake Arrowhead Water Agency
	Joshua Basin County Water District
Ventura County:	Camarillo County Water District
San Luis Obispo County:	Mooro Del Mar County Water District
San Diego County:	Del Luz Heights Municipal Water District
	Catwood in the Pines County Water District
	Yuima Municipal Water District
	Mootmai Municipal Water District

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE*

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-01.00	Lucerne Hydrologic Unit	7-19.00	Lucerne Valley
X-02.00	Johnson Hydrologic Unit	7-18.00	Johnson Valley
X-03.00	Bessemer Hydrologic Unit	7-15.00	Bessemer Valley
X-04.00	Means Hydrologic Unit	7-17.00	Means Valley
X-05.00	Emerson Hydrologic Unit	7-16.00	Ames Valley
X-06.00	Lavic Hydrologic Unit	7-14.00	Lavic Valley
X-07.00	Deadman Hydrologic Unit	7-13.00	Deadman Valley
X-08.00	Joshua Tree Hydrologic Unit	-	-
X-08.A0	Warren Hydrologic Subunit	7-12.00	Warren Valley
X-08.B0	Copper Mountain Hydrologic Subunit	7-11.00	Copper Mountain Valley
X-09.00	Dale Hydrologic Unit	-	-
X-09.A0	Twentynine Palms Hydrologic Subunit	7-10.00	Twentynine Palms Valley
X-09.B0	Dale Hydrologic Subunit	7- 9.00	Dale Valley
X-10.00	Bristol Hydrologic Unit	-	-
X-10.A0	Bristol Hydrologic Subunit	7- 8.00	Bristol Valley
X-10.B0	Fenner Hydrologic Subunit	7- 2.00	Fenner Valley
X-11.00	Cadiz Hydrologic Unit	7- 7.00	Cadiz Valley

*Boundaries of hydrologic areas are shown on Plates 1 and 10.

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-12.00	Ward Hydrologic Unit	7- 3.00	Ward Valley
X-13.00	Piute Hydrologic Unit	-	-
X-13.A0	Lanfair Hydrologic Subunit	7- 1.00	Lanfair Valley
X-13.B0	Piute Hydrologic Subunit	7-45.00	Piute Valley
X-13.C0	Needles Hydrologic Subunit	7-44.00	Needles Valley
X-14.00	Chemehuevis Hydrologic Unit	7-43.00	Chemehuevis Valley
X-15.00	Colorado Hydrologic Unit	-	-
X-15.A0	Vidal Hydrologic Subunit	7-42.00 7-41.00	Vidal Valley Calzona Valley
X-15.B0	Big Wash Hydrologic Subunit	-	-
X-15.C0	Quien Sabe Hydrologic Subunit	7-40.00	Quien Sabe Point Valley
X-15.D0	Palo Verde Hydrologic Subunit	7-39.00 7-38.00	Palo Verde Mesa Valley Palo Verde Valley
X-15.E0	Arroyo Seco Hydrologic Subunit	7-37.00	Arroyo Seco Valley
X-16.00	Rice Hydrologic Unit	7- 4.00	Rice Valley
X-17.00	Chuckwalla Hydrologic Unit	-	-
X-17.A0	Ford Hydrologic Subunit	7- 5.00	Chuckwalla Valley (Now only a portion of this area is utilized; the remainder is Palen Hydrologic Subunit, X-17.B0)

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-17.B0	Palen Hydrologic Subunit	7- 5.00	Chuckwalla Valley (Now only a portion of this area is utilized; the remainder is Ford Hydrologic Subunit, X-17.A0)
X-17.C0	Pinto Hydrologic Subunit	7- 6.00	Pinto Valley (Now only a portion of this area is utilized; the remainder is Pleasant Hydrologic Subunit, X-17.D0)
X-17.D0	Pleasant Hydrologic Subunit	7- 6.00	Pinto Valley (Now only a portion of this area is utilized; the remainder is Pinto Hydrologic Subunit, X-17.C0)
X-18.00	Hayfield Hydrologic Unit	7-31.00	Orcopia Valley (Now only a portion of this area is utilized; the remainder is Shavers Hydrologic Subunit, X-19.B0)
X-19.00	Whitewater Hydrologic Unit	-	-
X-19.A0	Morongo Hydrologic Subunit	7-20.00	Morongo Valley
X-19.B0	Shavers Hydrologic Subunit	7-31.00	Orcopia Valley (Now only a portion of this area is utilized; the remainder is Hayfield Hydrologic Unit, X-18.00)
X-19.C0	San Gorgonio Hydrologic Subunit	7-21.00	Coachella Valley (Now only a portion of this area is utilized; the remainder is Coachella Hydrologic Subunit, X-19.D0)

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-19.C1	Beaumont Hydrologic Subarea	-	-
X-19.C2	San Gorgonio Hydrologic Subarea	-	-
X-19.D0	Coachella Hydrologic Subunit	7-21.00	Coachella Valley (Now only a portion of this area is utilized; the remainder is San Gorgonio Hydrologic Subunit, X-19.C0)
X-19.D1	Garnet Hill Hydrologic Subarea	-	-
X-19.D2	Mission Creek Hydrologic Subarea	-	-
X-19.D3	Miracle Hill Hydrologic Subarea	-	-
X-19.D4	Sky Valley Hydrologic Subarea	-	-
X-19.D5	Fargo Canyon Hydrologic Subarea	-	-
X-19.D6	Thousand Palms Hydrologic Subarea	-	-
X-19.D7	Indio Hydrologic Subarea	-	-
X-20.00	Clark Hydrologic Unit	7-23.00	Clark Valley
X-21.00	West Salton Sea Hydrologic Unit	7-22.00	West Salton Sea Valley
X-22.00	Anza-Borrego Hydrologic Unit	-	-

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-22.A0	Borrego Hydrologic Subunit	-	-
X-22.A1	Terwilliger Hydrologic Subarea	7-26.00	Terwilliger Valley
X-22.A2	Collins Hydrologic Subarea	7-24.00	Borrego Valley (Now only a portion of this area is utilized; the remainder is Borrego Hydrologic Subarea, X-22.A3)
X-22.A3	Borrego Hydrologic Subarea	7-24.00	Borrego Valley (Now only a portion of this area is utilized; the remainder is Collins Hydrologic Subarea, X-22.A2)
X-22.B0	Ocotillo-Lower San Felipe Hydrologic Subunit	7-25.00 7-30.00	Ocotillo Valley Portion of Imperial Valley
X-22.C0	Mescal Bajada Hydrologic Subunit	7-27.00	San Felipe Valley (Now only a portion of this area is utilized; the remainder is San Felipe Hydrologic Subunit, X-22.D0)
X-22.D0	San Felipe Hydrologic Subunit	7-27.00	San Felipe Valley (Now only a portion of this area is utilized; the remainder is Mescal Bajada Hydrologic Subunit, X-22.C0)
X-22.E0	Mason Hydrologic Subunit	-	-
X-22.F0	Vallecito-Carrizo Hydrologic Subunit	-	-

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-22.F1	Carrizo Hydrologic Subarea	7-28.00	Vallecito-Carrizo Valle (Now only a portion of this area is utilized; the remainder is Valle-cito Hydrologic Subarea X-22.F2)
X-22.F2	Vallecito Hydrologic Subarea	7-28.00	Vallecito-Carrizo Valle (Now only a portion of this area is utilized; the remainder is Carri: Hydrologic Subarea, X-22.F1)
X-22.F3	Canebrake Hydrologic Subarea	7-46.00	Canebrake Valley
X-22.G0	Jacumba Hydrologic Subunit	-	-
X-22.G1	McCain Hydrologic Subarea	-	-
X-22.G2	Jacumba Hydrologic Subarea	7-47.00	Jacumba Valley
X-23.00	Imperial Hydrologic Unit	-	-
X-23.A0	Imperial Hydrologic Subunit	7-30.00 7-33.00	Portion of Imperial Valley Portion of East Salton Sea Valley
X-23.B0	Coyote Wells Hydrologic Subunit	7-29.00	Coyote Wells Valley
X-24.00	Davies Hydrologic Unit	-	-

NAMES AND AREAL CODE NUMBERS
COLORADO RIVER BASIN DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
X-25.00	East Salton Sea Hydrologic Unit	7-32.00	Chocolate Valley
		7-33.00	Portion of East Salton Sea Valley
X-26.00	Amos-Ogilby Hydrologic Unit	7-34.00	Amos Valley
		7-35.00	Ogilby Valley
X-27.00	Yuma Hydrologic Unit	7-36.00	Yuma Valley

NAMES AND AREAL CODE NUMBERS

SANTA ANA DRAINAGE PROVINCE (Y)

ATTACHMENT 5

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE*

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-01.00	Santa Ana River Hydrologic Unit	-	-
Y-01.A0	Lower Santa Ana River Hydrologic Subunit	-	-
Y-01.A1	East Coastal Plain Hydrologic Subarea	8- 1.01	East Coastal Plain Pressure Area (Now only a portion of this area is utilized; the remainder is Anaheim Hydrologic Subarea, U-05.F1)
		8- 1.02	Santa Ana Forebay Area (Now only a portion of this area is utilized; the remainder is Anaheim Hydrologic Subarea, U-05.F1)
		8- 1.03	Irvine Basin
Y-01.A2	Santiago Hydrologic Subarea	8- 1.07	Santiago Basin
Y-01.A3	Santa Ana Narrows Hydrologic Subarea	8- 1.06	Santa Ana Narrows Basin
Y-01.B0	Middle Santa Ana River Hydrologic Subunit	-	-
Y-01.B1	Chino Hydrologic Subarea	8- 2.01	Chino Basin
		4-14.01	Chino Basin

*Boundaries of hydrologic areas are shown on Plates 1 and 11.

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-01.B2	Harrison Hydrologic Subarea	4-14.02	Pomona Basin (Now only a portion of this area is utilized; the remainder is Pomona Hydrologic Subarea, U-05.E2)
Y-01.B3	Claremont Heights Hydrologic Subarea	8- 2.02 4-14.04	Claremont Heights Basin Claremont Heights Basin (Now only a portion of this area is utilized; the remainder is Live Oak Hydrologic Subarea, U-05.E3)
Y-01.B4	Cucamonga Hydrologic Subarea	8- 2.03	Cucamonga Basin
Y-01.B5	Temescal Hydrologic Subarea	8- 2.17	Temescal Basin
Y-01.B6	Arlington Hydrologic Subarea	8- 2.16	Arlington Basin
Y-01.B7	Riverside Hydrologic Subarea	8- 2.15	Riverside Basin
Y-01.C0	Lake Mathews Hydrologic Subunit	-	-
Y-01.C1	Coldwater Hydrologic Subarea	8- 2.19	Coldwater Basin
Y-01.C2	Bedford Hydrologic Subarea	8- 2.18	Bedford Basin
Y-01.C3	Cajalco Hydrologic Subarea	8- 3.00	Cajalco Valley

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-01.C4	Lee Lake Hydrologic Subarea	8- 2.20	Lee Lake Basin
Y-01.C5	Terra Cotta Hydrologic Subarea	-	-
Y-01.D0	Colton-Rialto Hydrologic Subunit	-	-
Y-01.D1	Upper Lytle Hydrologic Subarea	-	-
Y-01.D2	Lower Lytle Hydrologic Subarea	-	-
Y-01.D3	Upper Colton-Rialto Hydrologic Subarea	8- 2.04	Portion of Rialto Basin
Y-01.D4	Colton-Rialto Hydrologic Subarea	8- 2.05 8- 2.04	Colton Basin Portion of Rialto Basin
Y-01.D5	Reche Hydrologic Subarea	8- 2.14	Reche Canyon Basin
Y-01.E0	Upper Santa Ana Hydrologic Subunit	-	-
Y-01.E1	Cajon Hydrologic Subarea	8- 2.08	Upper Cajon Basin
Y-01.E2	Bunker Hill Hydrologic Subarea	8- 2.09 8- 2.10 8- 2.06	Lower Cajon Basin Devil Canyon Basin Portion of Bunker Hill Basin
Y-01.E3	Redlands Hydrologic Subarea	8- 2.06	Portion of Bunker Hill Basin
Y-01.E4	Mentone Hydrologic Subarea	8- 2.06	Portion of Bunker Hill Basin

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-01.E5	Reservoir Hydrologic Subarea	8- 2.06	Portion of Bunker Hill Basin
Y-01.E6	Crafton Hydrologic Subarea	8- 2.13	Portion of San Timoteo Basin
Y-01.E7	Santa Ana Canyon Hydrologic Subarea	8- 2.06	Portion of Bunker Hill Basin
Y-01.E8	Mill Creek Hydrologic Subarea	8- 2.06	Portion of Bunker Hill Basin
Y-01.E9	Sycamore Hydrologic Subarea	8- 2.07	Lytle Basin
Y-01.F0	San Timoteo Hydrologic Subunit	-	-
Y-01.F1	Yucaipa Hydrologic Subarea	8- 2.13	Portion of San Timoteo Basin
Y-01.F2	San Timoteo Hydrologic Subarea	8- 2.13	Portion of San Timoteo Basin
		8- 2.12	Portion of Beaumont Basi
Y-01.F3	Cherry Valley Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin
		8- 2.12	Portion of Beaumont Basi
Y-01.F4	Chicken Hill Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin
Y-01.F5	Gateway Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin
Y-01.F6	Oak Glen Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin
Y-01.F7	South Mesa Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-01.F8	Triple Falls Creek Hydrologic Subarea	8- 2.11	Portion of Yucaipa Basin
Y-01.F9	Nobie Creek Hydrologic Subarea	8- 2.12	Portion of Beaumont Basin
Y-01.G0	San Bernardino Mountain Hydrologic Subunit	-	-
Y-01.G1	Bear Valley Hydrologic Subarea	8- 9.00	Portion of Bear Valley
Y-01.G2	Seven Oaks Hydrologic Subarea	8- 7.00 8- 8.00	Big Meadows Valley Seven Oaks Valley
Y-01.G3	Baldwin Hydrologic Subarea	8- 9.00	Portion of Bear Valley
Y-02.00	San Jacinto Valley Hydrologic Unit	8- 5.00 8- 6.00	San Jacinto Valley Hemet Lake Valley
Y-02.A0	Perris Hydrologic Subunit	-	-
Y-02.A1	Perris Valley Hydrologic Subarea	-	-
Y-02.A2	Menifee Hydrologic Subarea	-	-
Y-02.A3	Winchester Hydrologic Subarea	-	-
Y-02.A4	Lakeview Hydrologic Subarea	-	-
Y-02.A5	Hemet Hydrologic Subarea	-	-

NAMES AND AREAL CODE NUMBERS
SANTA ANA DRAINAGE PROVINCE
(continued)

New Designation		Old Designation	
Code	Hydrologic Unit, Hydrologic Subunit and Hydrologic Subarea	Code	Basin or Valley
Y-02.B0	San Jacinto Hydrologic Subunit	-	-
Y-02.B1	San Jacinto Hydrologic Subarea	-	-
Y-02.B2	Hemet Lake Hydrologic Subarea	8- 6.00	Hemet Lake Valley
Y-02.B3	Bautista Hydrologic Subarea	-	-
Y-02.C0	Elsinore Hydrologic Subunit	8- 4.00	Elsinore Valley
Y-02.C1	Elsinore Hydrologic Subarea	-	-
Y-02.C2	Railroad Hydrologic Subarea	-	-

APPENDIX A

CLIMATE

TABLE OF CONTENTS

Agency Code

The agency code used in this report for precipitation data consists of four numerical characters for indicating the agency supplying the data. The complete agency code number, which is not used in this report, requires a fifth character to indicate the drainage province.

Agency Code for Central Coastal Drainage Province (T)

Agency Code	Agency Name
2100	Ventura County Flood Control District
4002	U. S. Army Corps of Engineers, Los Angeles
4004	U. S. Weather Bureau
4111	San Luis Obispo County Farm Agent

Agency Code for Los Angeles Drainage Province (U)

Agency Code	Agency Name
1101	Los Angeles County Flood Control District
2100	Ventura County Flood Control District
4004	U. S. Weather Bureau

Agency Code for Lahontan Drainage Province (W)

Agency Code	Agency Name
1101	Los Angeles County Flood Control District
1200	Los Angeles Department of Water and Power
4004	U. S. Weather Bureau
5100	San Bernardino County Flood Control District

Agency Code for Colorado River Basin Drainage Province (X)

Agency Code	Agency Name
4004	U. S. Weather Bureau
4103	Riverside County Flood Control and Water Conservation District

Agency Code for Santa Ana Drainage Province (Y)

Agency Code	Agency Name
1101	Los Angeles County Flood Control District
3102	Orange County Flood Control District
3200	San Bernardino Water Department
4004	U. S. Weather Bureau
4103	Riverside County Flood Control and Water Conservation District
4701	Corona Foothill Mutual Lemon Company
4706	Fontana Union Water Company
4730	Crafton Orange Growers Association
4731	Garrett and Company
4732	Gold Buckle Association
4740	Southern California Edison Company
5100	San Bernardino County Flood Control District
5717	Temescal Water Company

Agency Code for San Diego Drainage Province (Z)

Agency Code	Agency Name
3102	Orange County Flood Control District
4002	U. S. Army Corps of Engineers, Los Angeles
4004	U. S. Weather Bureau
